Innovation points

- **Ingestion of a foreign body can cause chest pain, and the esophagus is the most frequent site of obstruction in the gastrointestinal tract due to luminal narrowing.**

- **Chest pain is one of the most common complaints in the emergency department. Diseases of the heart, aorta, lungs, esophagus, stomach, mediastinum, pleura, and abdominal viscera can all cause chest discomfort.**

Innovation points

- **China has a diverse food culture, and many Chinese people are accustomed to gnawing on chicken, duck, and pork bones, greatly increasing the risk of EFBs in adults**

- **Even if the patient has a history of heart disease, the possibility of esophageal foreign body ingestion must be considered.**
