

Conclusions:

- 1. The proposed NUSAP method was proved the efficiency evaluating both the qualitative and quantitative uncertainty of regional frequency analysis.
- 2. The diagnostic diagram is a helpful tool for a sision makers to have an overview of the quality and quantity of data source, methods or mode employed within the regional frequency analysis.

Discussion

- 1. Although the poligree matex is used to code qualitative expert judgments for minimizing the arbitrariness at subjectivity in measuring strength, much more efforts should be done (e. g. formal question vires
- 2. Limited data, methods and models were used in this case study for illustration of the NUSAP method, which resulted in an underestimation of uncertainty in regional frequency analysis.
